Visual Studio not connecting to Web Service

When Visual Studio connects to a web service to create a reference it needs to make use of your internet connection. To do this it imports your internet connection settings from IE. If IE is not your primary browser or if you have recently installed a Firewall / Proxy server to your network Visual Studio will not connect through.

You will get an error stating “Unable to connect to the remote server”.

To correct this you must then tell the application to use the default proxy in you web.config or app.config file. Once this is done for one app, Visual Studio should remember this setting and all future apps should does not need this code thereafter.

Example:

```
<system.net>
```

```
  <defaultProxy>
```

```
    <proxy autoDetect="true" />
```

```
  </defaultProxy>
```

```
</system.net>
```

OR

```
<system.net>
```

```
  <defaultProxy useDefaultCredentials="true" >
```

```
  </defaultProxy>
```

```
</system.net>
```
